Reflection

I learned how to use loops in a Java program to repeat instructions in this chapter. In addition to learning how to track variables and calculate totals using counters and accumulators, I also learned the difference between while and do-while loops. Additionally, I learned that incorrect condition setup can lead to endless cycles.

I thought it was essential to learn how to debug a program. By using println() instructions to display variable values, I can better understand what's happening in my code and spot errors.

Overall, instead of writing the same code over and over again, this chapter helped me better understand how to use loops to increase program efficiency. I still need to practice choosing the right loop structure and checking the criteria to make sure my programs run properly.

What I Could Improve

I could improve by solving more loop problems and closely observing how many times each loop runs. I also want to get better at spotting logical errors and testing my programs with different inputs before declaring them complete.
