Java Programming Error Log

Credit Name: File Structures & Exception Handling

Assignment Name: WordGuess

Error Log Entry 1: FileNotFoundException

What error message did you encounter (if any)?

```
File does not exist or could not be found.

FileNotFoundException: words.txt (The system cannot find the file specified)
```

What unexpected behavior did your program exhibit?

The program stopped before the WordGuess game could start because it could not find the file containing the words.

What caused the issue? (e.g., syntax error, logic error, incorrect function usage, etc.)

The program was trying to open a file named `words.txt`, but the file was either not created or was saved in a different folder from the directory where Eclipse was looking for it. This was a file-handling error.

Include a screenshot of specific lines of code.

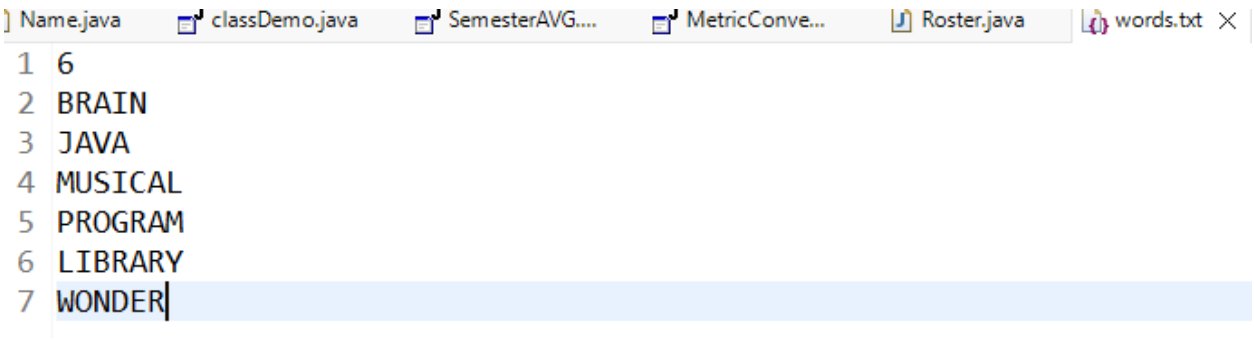

Insert a screenshot of the lines that create the file and open it, including:

```
File wordFile = new File("words.txt");
in = new FileReader(wordFile);
readFile = new BufferedReader(in);
```

How did you fix the issue?

I created a separate text file named `words.txt` in my Eclipse project and added words, with one word on each line. I saved the file and ran the program again. If the error continues, I need to make sure the file is in the program's working directory.

Provide the corrected code or solution using a screenshot.

Error Log Entry 2: File Reading and Word Selection

What error message did you encounter (if any)?

No separate error message was confirmed for this issue.

What unexpected behavior did your program exhibit?

The program needed to count the words in the file and select a secret word. The code needed to use the correct method to count the lines in `words.txt`.

What caused the issue? (e.g., syntax error, logic error, incorrect function usage, etc.)

The method name used to count the words needed to match the method defined in the program. The earlier code used `readFile()` and was then changed to `countWords()`. If the method call and method definition do not match, the program will not compile.

Include a screenshot of specific lines of code.

Insert a screenshot showing the line that counts the words and the method definition:

numWords = countWords();

How did you fix the issue?

I changed the method call to `countWords()` so it matches the method definition. The method reads the file one line at a time, counts the lines, closes the file readers, and returns the total number of words.

Provide the corrected code or solution using a screenshot.
